- Part I: Chamber experiments, mechanism development and evaluation
- Part II: CMAQ simulations
- Conclusions

# Background: Ozone and HRVOC emissions

- Emissions of Highly Reactive Volatile Organic Compounds (HRVOCs) contribute to ozone pollution in Houston.
- Emissions of HRVOCs (ethene, propene, isobutene, 1-butene, cis-2-butene, trans-2-butene, 1,3-butadiene) are regulated in Southeast Texas (Title 30, Texas Administrative Code, Chapter 115; TCEQ, 2013, <http://www.tceq.texas.gov/airquality/stationary-rules/voc/hrvoc.html>).

(Source: <http://maps.google.com>)

# Background: HRVOC emissions and chemical mechanisms

- **Condensed chemical mechanisms** commonly used for air quality modeling are designed to model O<sub>3</sub> formation from typical urban ambient VOC mixtures.
- **Reliable chamber experimental data for mechanism evaluation** are available only for ethene and propene among the 7 alkenes regulated as HRVOCs.

## 7 HRVOC alkenes

Ethene (CH<sub>2</sub>=CH<sub>2</sub>)

Propene (CH<sub>2</sub>=CHCH<sub>3</sub>)

1-Butene (CH<sub>2</sub>=CHCH<sub>2</sub>CH<sub>3</sub>)

trans-2-Butene (CH<sub>3</sub>CH=CHCH<sub>3</sub>)

cis-2-Butene (CH<sub>3</sub>CH=CHCH<sub>3</sub>)

Isobutene (CH<sub>2</sub>=C(CH<sub>3</sub>)<sub>2</sub>)

1,3-Butadiene (CH<sub>2</sub>=CHCH=CH<sub>2</sub>)

## Non-HRVOC alkenes in urban emissions

1-Pentene (CH<sub>2</sub>=CHCH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>)

1-Hexene (CH<sub>2</sub>=CHCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>)

trans-2-Pentene (CH<sub>3</sub>CH=CHCH<sub>2</sub>CH<sub>3</sub>)

cis-2-Pentene (CH<sub>3</sub>CH=CHCH<sub>2</sub>CH<sub>3</sub>)

2-Methyl-2-butene (CH<sub>3</sub>CH=C(CH<sub>3</sub>)<sub>2</sub>)

# Overall approach of this project

- **Project team:**
  - Gookyoung Heo and William Carter (UCR)
  - Qi Ying (TAMU)
- **Overall objective:** Develop more reliable chemical mechanisms that can be used to simulate ozone formation from both urban emissions and industrial HRVOC emissions.
- **Tasks of this project:**
  - Design and carry out chamber experiments (UCR)
  - Evaluate and develop mechanisms (UCR)
  - Implement mechanisms into CMAQ (TAMU)
  - Carry out CMAQ simulations (TAMU)
- **Project officers:**
  - Elena McDonald-Buller (AQRP project officer)
  - Ron Thomas (TCEQ liaison)

# Part I: Experiments carried out at UCR

- 25 experiments (50 reactor runs) for the 10 test alkenes.
- 11 experiments for chamber characterization or quality assurance.
- 36 reactor runs were selected and used for evaluating and improving mechanisms.

UCR's EPA chamber building Dual reactors (two reactors)

Compound	Planned	Carried out	Used
1-butene	3	4	4
isobutene	3	5	4
trans-2-butene	2	4	3
cis-2-butene	3	6	4
1,3-butadiene	3	4	4
1-pentene	2	4	4
1-hexene	2	5	5
cis-2-pentene	2	4	2

# Mechanisms and performance metrics used

- Mechanisms used:
  - SAPRC-07T (S07T): “toxics” version of SAPRC-07 already implemented and available in CMAQ (Hutzell et al, 2012).
  - SAPRC-11D (S11D): detailed SAPRC-11 which uses updated reactions for aromatic compounds (Carter and Heo, 2013) and ~330 model species to more explicitly represent reactive VOC emissions.
  - SAPRC-11L (S11L): standard-lumped version of SAPRC-11 using the same lumping methods used for the standard-lumped **SAPRC-07L** (Carter, 2010).
- Performance metrics:
  - Maximum O<sub>3</sub>: highest O<sub>3</sub> concentration by the end of the experiment if O<sub>3</sub> increases by less than or equal to 5% in the last 30 minutes of the experiment.
  - D(O<sub>3</sub>-NO) Rate: average rate of change of D(O<sub>3</sub>-NO) between the starting time of the irradiation (i.e., t = 0) and the time of 0.5·Max(D(O<sub>3</sub>-NO))

**D(O<sub>3</sub>-NO)** = accumulated O<sub>3</sub> formation and NO oxidation  
 = ([O<sub>3</sub>]<sub>t</sub> - [O<sub>3</sub>]<sub>0</sub>) + ([NO]<sub>0</sub> - [NO]<sub>t</sub>)

# Mechanism evaluation and development: (1) Propene

Max( $D(O_3-NO)$ )

$0.5 \cdot \text{Max}(D(O_3-NO))$

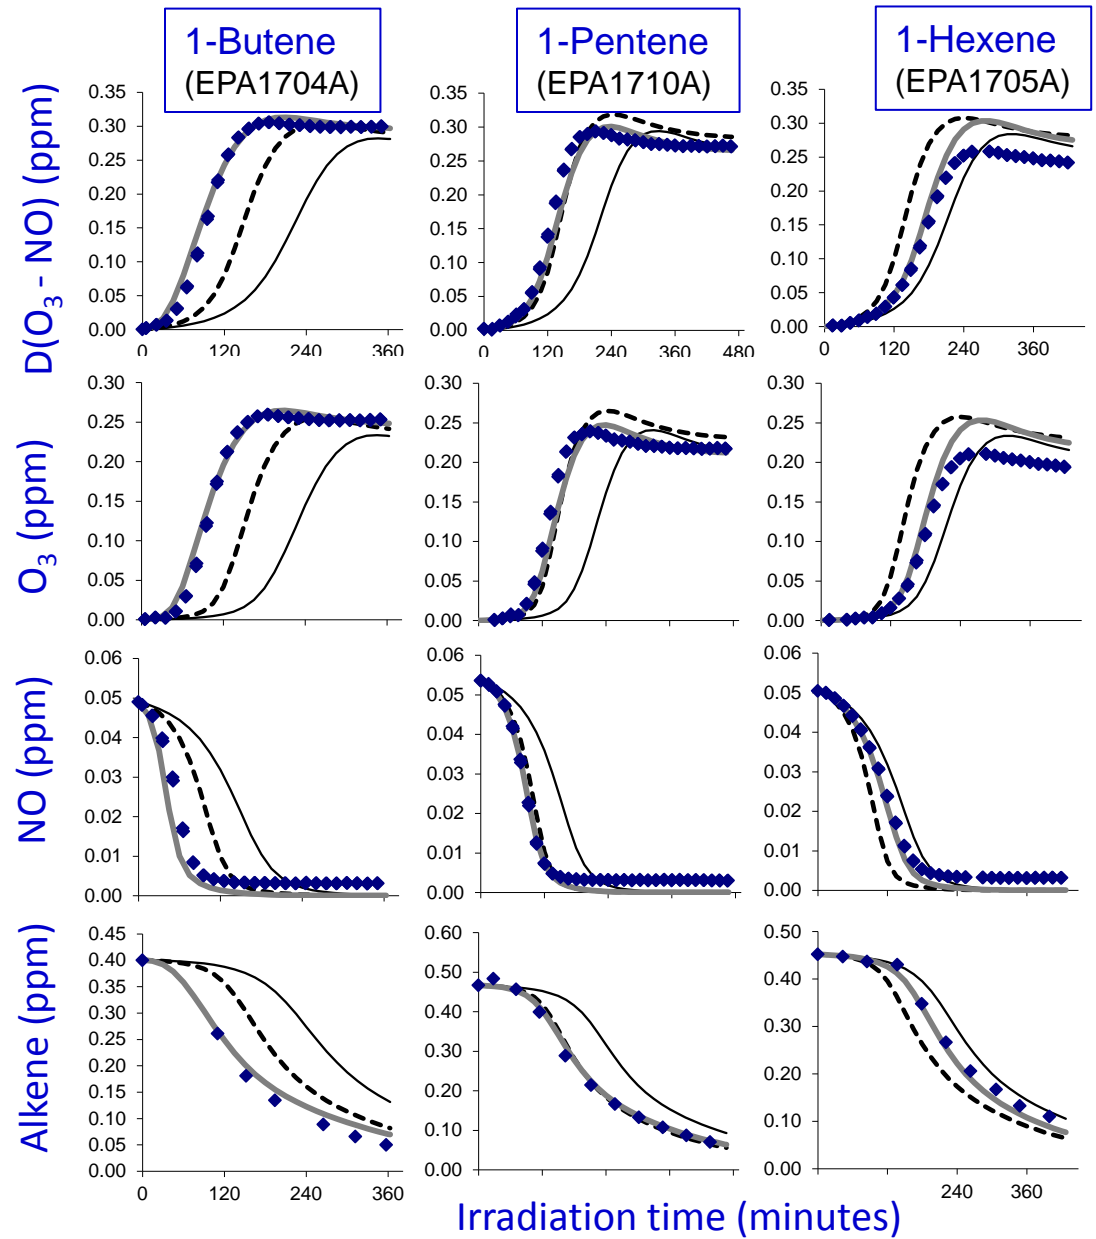

$D(O_3-NO) = \text{accumulated } O_3 \text{ formation and NO oxidation} = ([O_3]_t - [O_3]_0) + ([NO]_0 - [NO]_t)$

The model performance with SAPRC-11D indicates that the quality of experimental data generated for this project is reasonable for mechanism evaluation.

## (2) Unbranched terminal alkenes

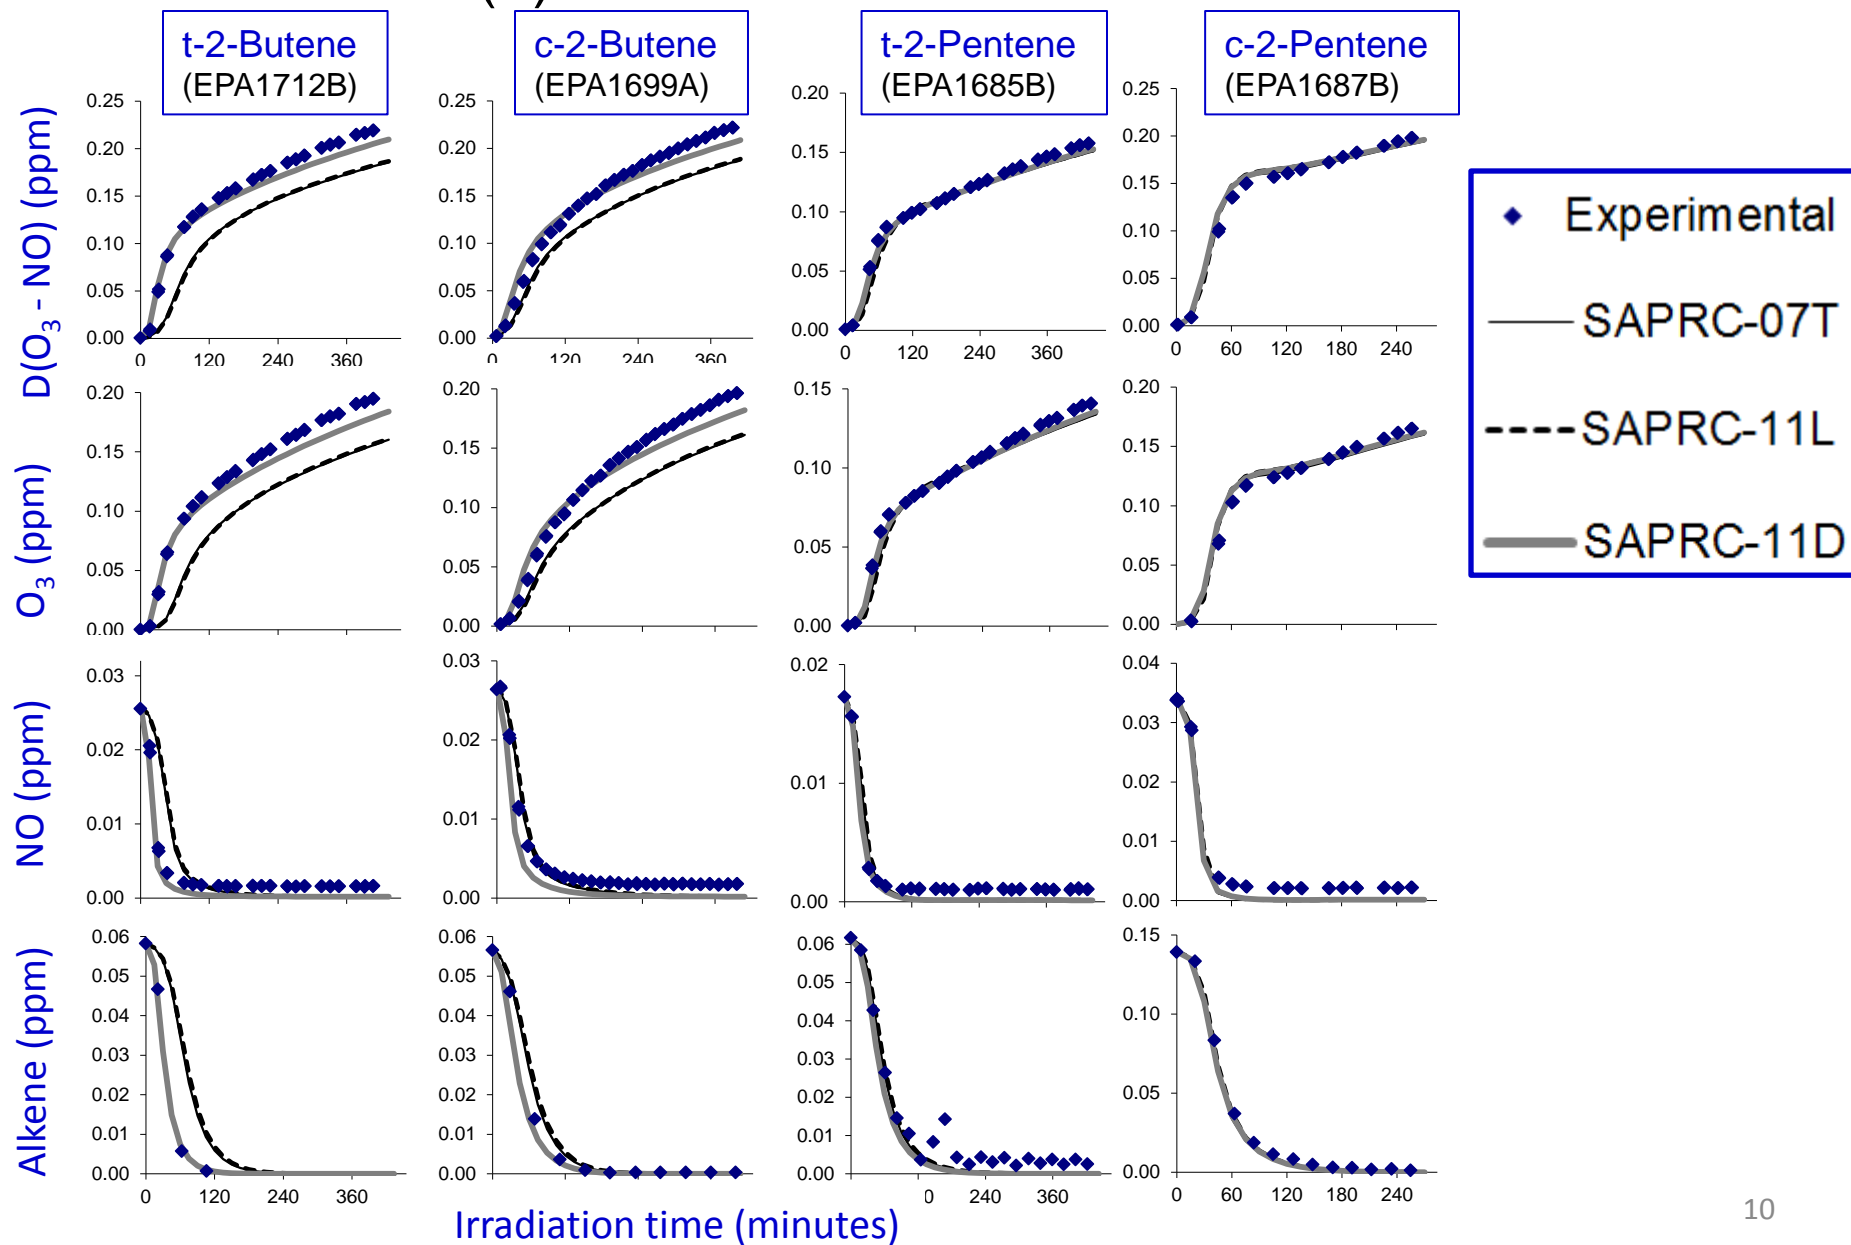

For 1-hexene, even with SAPRC-11D, Max(O<sub>3</sub>) was overpredicted, and SAPRC-07T better simulated Max(O<sub>3</sub>) than SAPRC-11D.

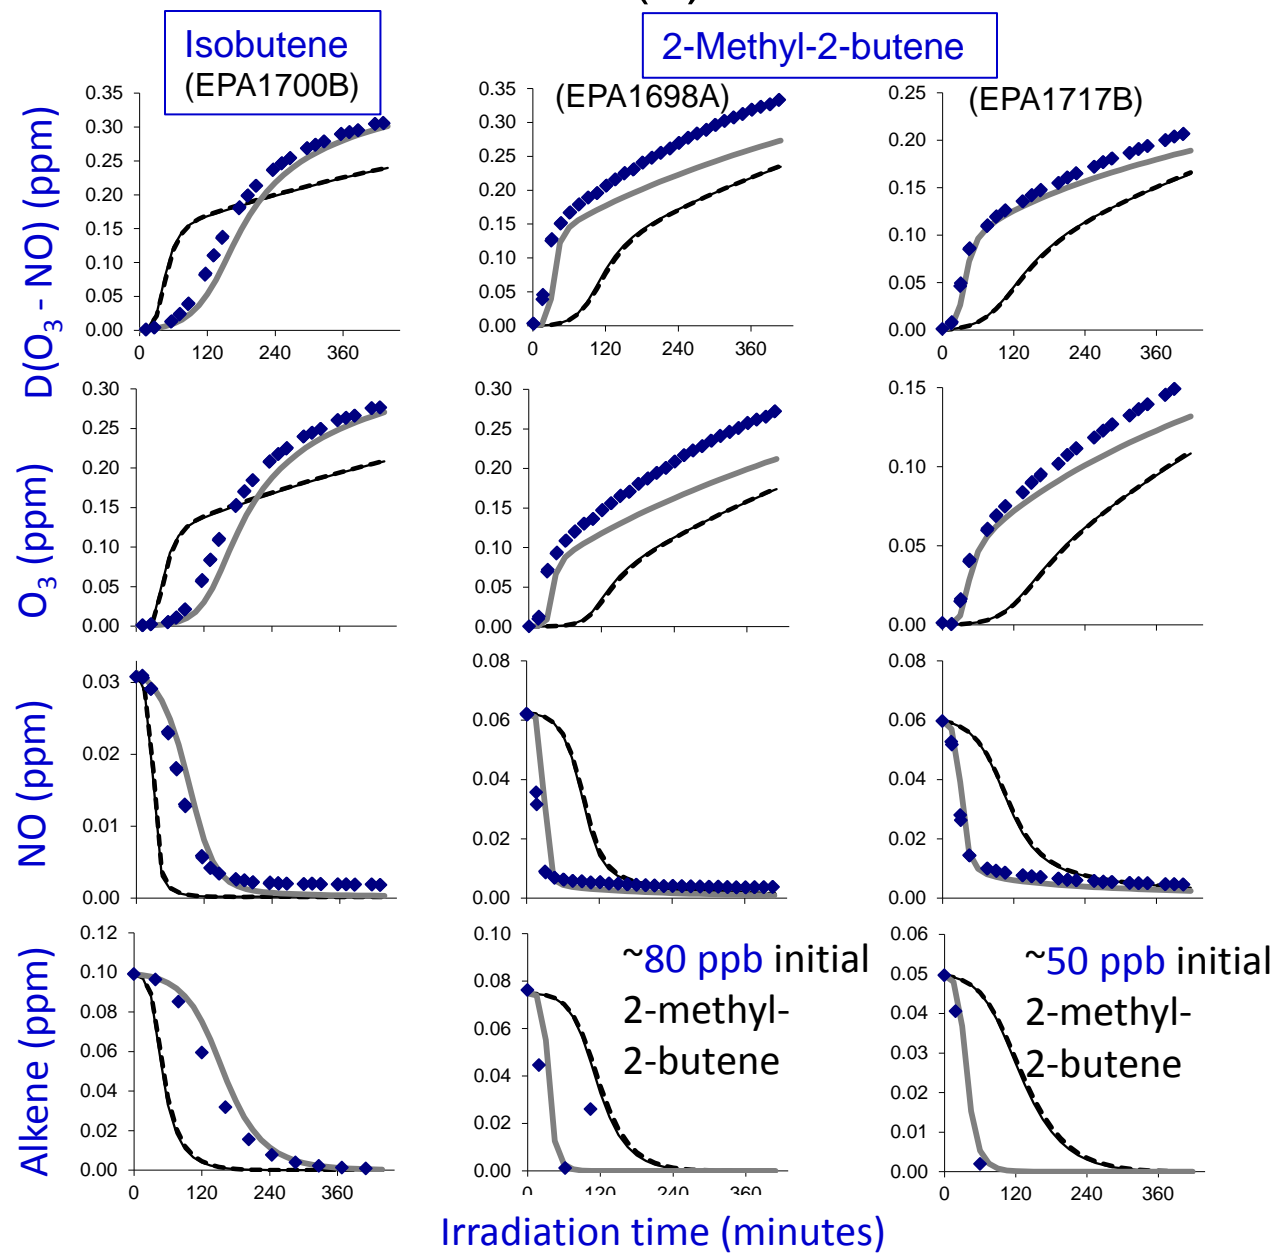

In a test version of SAPRC-11D, increasing the NO<sub>x</sub> sink resulted in improving the Max(O<sub>3</sub>) performance.

Note: 1-hexene behaves differently from 1-butene and 1-pentene due to a major role of H-shift isomerization of alkoxy radicals (RO') formed from reaction with OH.

### (3) Unbranched internal alkenes

# (4) Branched alkenes

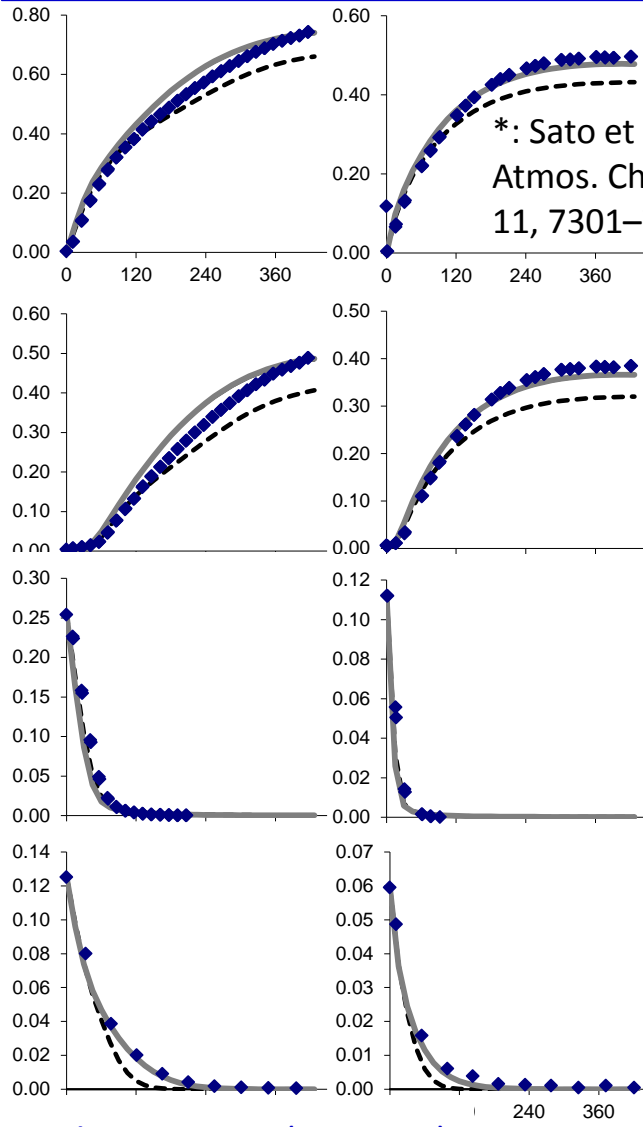

Isobutene and 2-methyl-2-butene are difficult to model with the lumped OLE2 reactions (which work reasonably for cis/trans 2-butene and 2-pentene).  
 Even with SAPRC-11D, Max(O<sub>3</sub>) for 2-methyl-2-butene was underpredicted.

# (5) 1,3-Butadiene

EPA1700B

Previous expts\* with added H<sub>2</sub>O<sub>2</sub>: EPA1702A and EPA1072B

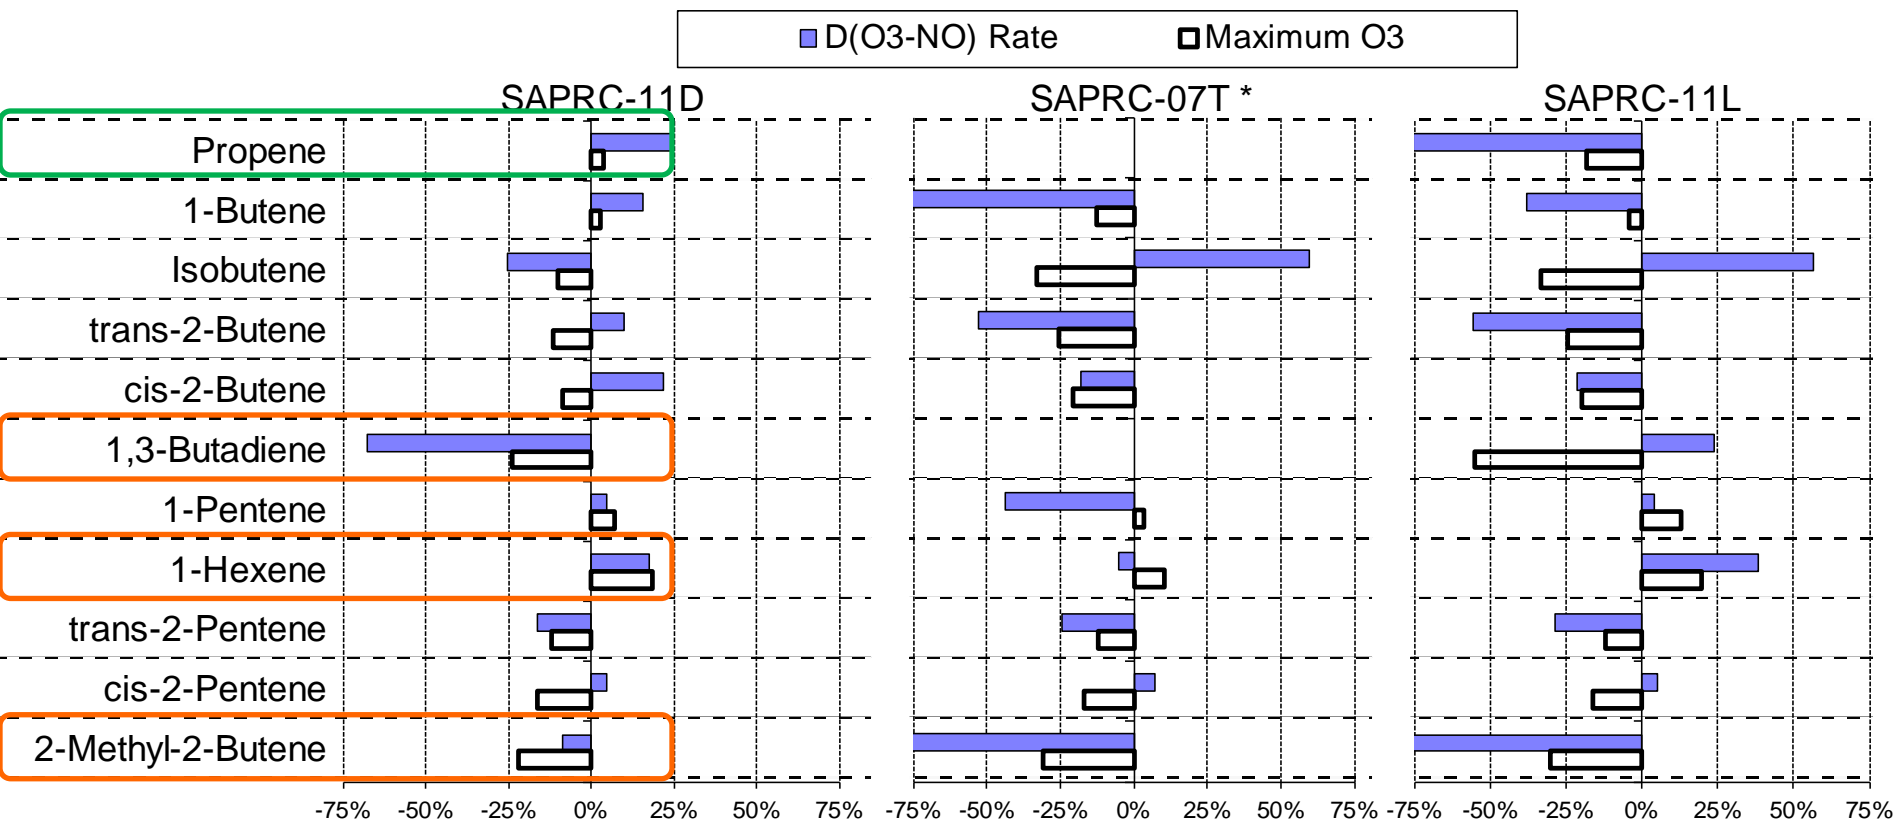

\*: Sato et al (2011, Atmos. Chem. Phys., 11, 7301-7317)

For 1,3-butadiene experiments carried out for this project, all mechanisms showed poor performance. This problem was not detected by previous experiments with added H<sub>2</sub>O<sub>2</sub> by Sato et al (2011).  
In a test version of SAPRC-11D, increasing the radical yield in the reaction of 1,3-butadiene with O<sub>3</sub> resulted in improving the model performance.

Irradiation time (minutes)

# Mechanism performance summary

$$\text{Model bias} = (\text{model} - \text{experiment}) / \text{average}(\text{model}, \text{experiment})$$

\*Results are not shown for SAPRC-07T simulations of propene and 1,3-butadiene because these compounds are represented explicitly so the results are essentially the same as for SAPRC-11D.

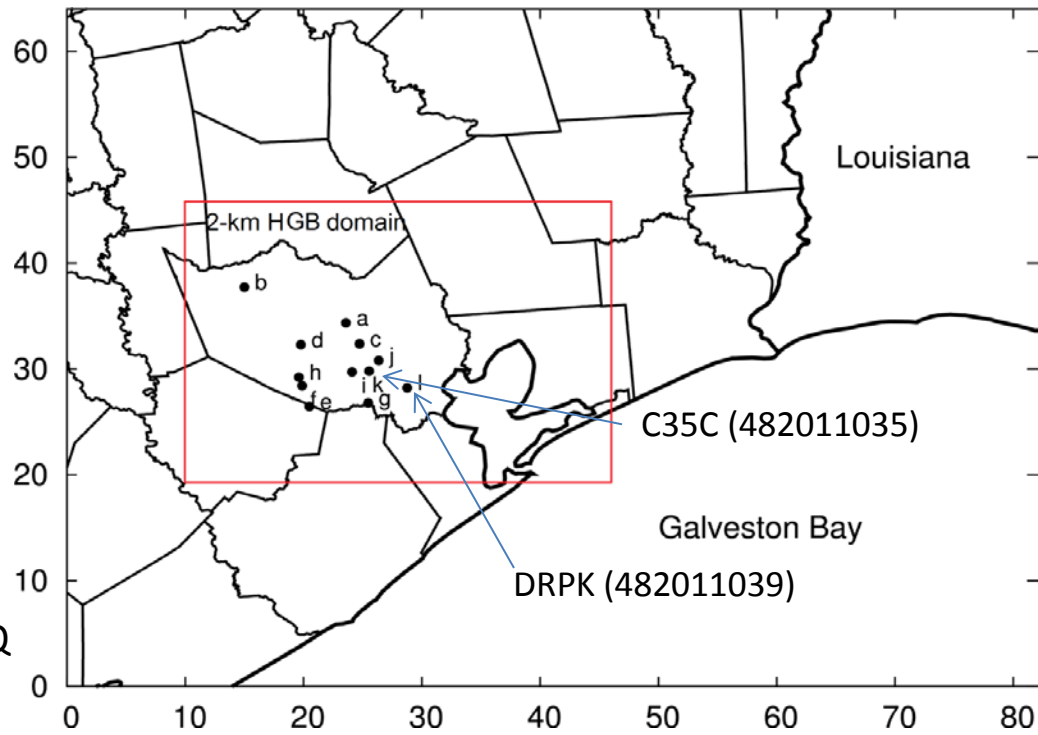

The average model biases of D(O<sub>3</sub>-NO) Rate by SAPRC-07T for 1-butene and 2-methyl-2-butene were -76% and -106%, respectively. The average model biases of D(O<sub>3</sub>-NO) Rate by SAPRC-11L for propene and 2-methyl-2-butene were -75% and -107%, respectively.

# Part I - Summary

- This project generated **experimental data useful to evaluate mechanisms** for the 10 alkenes (5 HROVCs and 5 non-HRVOCs).
- The **detailed SAPRC-11 (SAPRC-11D)** modeled ozone formation from the tested alkenes generally better than the condensed versions.
- SAPRC-11D also showed limitations:
  - (1) overpredicted Max(O<sub>3</sub>) for **1-hexene** by ~20%.
  - (2) underpredicted Max(O<sub>3</sub>) for **2-methyl-2-butene** by ~20%.
  - (3) underpredicted the ozone formation and NO oxidation rate by ~65% and underpredicted Max(O<sub>3</sub>) for **1,3-butadiene** by ~25%.
- The results for propene, 1-butene, 1-pentene and 1-hexene indicate that **C<sub>3+</sub> 1-alkenes** share similar O<sub>3</sub> formation chemistries but also have differences among those 1-alkenes.
- The results for cis/trans 2-butene and 2-pentene indicate that **unbranched internal alkenes** share similar ozone formation chemistries.
- **Isobutene and 2-methyl-2-butene** behave differently from unbranched internal alkenes in regard to ozone formation.

# Timing results

Time (hours per/day)

- All runs using 8 physical cores (each core is from an Intel Q6600 2.4GHz CPU node with 2G of DDR2 RAM)
- Gigabit Ethernet connection. Results write to an NFS mount.
- MPI: MPICH2 v2.1.4
- Program compiled using the Intel Fortran Compiler (ifort) v11.1 with the following compiler options:  
`-O3 -xSSSE3 -override-limits -fno-alias -mp1 -fp-model precise`
- Chemistry Solver: SMVGEAR solver in CMAQ

## Part II - Summary

- Predicted cis-2-butene, trans-2-butene, 1-pentene, cis-2-pentene and trans-2-pentene are lower than AutoGC measurements at C35C and DRPK (more significant at DRPK).
- S11D gives slightly better ozone model performance than S11L. 2-km and 4-km results are similar in terms of ozone model performance – 4 km is adequate for ozone modeling.
- S11D predicts higher O<sub>3</sub> and PAN throughout the domain than S11L. S11D predicts higher OH and HO<sub>2</sub> in urban Houston areas and lower OH and HO<sub>2</sub> in areas with less anthropogenic emissions than S11L.
- S11D is approximately 3 times more computationally intensive than other lumped mechanisms.

# Conclusions (1)

- This project has provided experimental data to evaluate mechanisms for the 10 studied compounds that will eventually contribute to increasing the accuracy of ozone predictions in Texas.
- The detailed SAPRC-11 (SAPRC-11D) reasonably simulated ozone formation from 7 of the 10 alkenes while the performance for 1,3-butadiene, 1-hexene and 2-methyl-2-butene was not satisfactory.
- Isoprene and 1,3-butadiene have many similar mechanistic features. Thus, knowledge gained during updating the isoprene chemistry should be used to update the 1,3-butadiene chemistry, and vice-versa.
- In re-deriving lumping methods for the tested 10 alkenes for the Houston area, reliable emissions data as well as the mechanism evaluation results of this project should be considered.

## Conclusions (2)

- Chemically detailed emissions data were useful in inspecting consistency between the compositions of the lumped alkene species (OLE1 and OLE2) used during deriving the mechanism and the emissions inventory data that air quality simulations heavily rely on.
- Explicitly modeling propene and 1,3-butadiene is potentially useful to improve the accuracy of ozone predictions based on the spatial variability of propene and 1,3-butadiene emissions in the Houston area.
- Detailed chemical mechanisms were able to yield better model performance than lumped mechanisms although at a cost of more computation time. A mechanism with a small number of important explicit VOC species should be developed to improve model performance without much penalty for computation time.
- Additional analysis (e.g., process analysis) is needed to explain differences in modeled O<sub>3</sub>, PAN, OH and HO<sub>2</sub> between SAPRC-11D and SAPRC-11L.
- Further work is needed to limit the impact of uncertainties in emissions on mechanism comparison under ambient conditions.

# Acknowledgements

- This presentation is based on work (AQRP Project 12-006) supported by the State of Texas through the Air Quality Research Program administered by The University of Texas at Austin by means of a grant from the Texas Commission on Environmental Quality.
